Dr. Tyson Is Excited To Announce That We Now Have An Option To Restore Near Vision And Reduce Dependence On Reading Glasses

It is estimated that nearly 114 million people in the United States are struggling with the frustratingly natural eye condition presbyopia. Typically occurring in those over 40, presbyopia reduces the ability of the eye to focus on near objects, causing blurry reading vision. An advanced surgical procedure to treat this condition is now available from here! The KAMRA™ inlay has helped thousands restore their near vision and reduce the constant frustrations of reading glasses.

“As I see more and more patients looking for a solution for reading glasses, I often get questions about effective treatments to improve near vision. This is especially true of any LASIK patients who gradually lose the ability to read without glasses after their 40’s.” said Dr. Tyson. “The KAMRA inlay offers an excellent option for the correction of presbyopia with minimal compromises and inconveniences that come with other treatment options. I am excited to offer the number one prescribed corneal inlay in the world to my patients.”

After much research and education, Dr. Tyson decided the KAMRA was a safe and effective procedure for his patients at Eye Associates. Eye Associates is the first again to bring this technique to New Jersey!

The KAMRA inlay sits in the first few layers of the eye known as the cornea. Smaller and thinner than a contact lens, the inlay is a mini-ring with an opening in the center. By using this pinhole effect, the inlay focuses light coming into your eye. This restores near vision while maintaining distance vision without blurry zones.

“For those who are experiencing presbyopia symptoms, such as trouble reading small print on cell phones and prescription labels, I recommend making an appointment for a FREE Evaluation with Dr. Tyson personally to see if you are a candidate.,” said Tammy Holliday, Refractive Coordinator. “Dr. Tyson can provide a proper diagnosis and discuss long-term treatment options, such as KAMRA inlay, which provides a natural range of vision from near to far.”

Please visit www.KAMRA.com for more information on presbyopia and the KAMRA inlay.
Dear Patients,

Are you frustrated with your reading glasses? Are you wishing you could stop depending on them? If so, you will be excited to know there’s an alternative to reading glasses that may be right for you!

In our 40s and 50s, we begin to experience the naturally frustrating effects of blurry near vision and reading simple things, like a menu or a cell phone, become a struggle. This loss of near vision is called presbyopia (prez-bee-OH-peeah). The KAMRA™ inlay treatment is an eye procedure that improves near vision and frees you from the constant frustrations of reading glasses.

- Restores everyday vision so you can see text messages, a computer screen and the time on your wrist watch, without the inconvenience of reading glasses or contact lenses
- Provides a natural range of vision – from near to far – without blurry zones
- Offers long-lasting performance to help you enjoy clear near vision over time

We are here to help you maintain a natural range of vision from near to far. Ask to be set up for your personal KAMRA inlay FREE consultation and find out if you’re a candidate!

Sincerely,
Dr. Tyson

WHAT WE HAVE ALL BEEN WAITING FOR !!!!

Before KAMRA

After KAMRA !!
Dr. Holzinger Trains Surgeons a Surgical Procedure For Missionary Trips at Wills Eye

Dr. Holzinger was an instructor for Manual Small Incision Cataract Surgery (MSICS) training course held at the Wills Eye Surgical Center in Cherry Hill on Saturday, May 21st. The course was designed to teach experienced cataract surgeons in the type of surgery that is optimal for mission settings. On missions, it is not possible to bring the necessary supplies to perform the state-of-the-art cataract surgery that we perform at Eye Associates. The machinery could not be transported, and the supplies and materials too costly. The cataracts are so advanced (completely blinding patients in most cases) that equipment we use at home cannot be used anyway.

A major stumbling block for surgeons interested in doing humanitarian eye missions is that they do not know how to do the technique required on these missions. The humanitarian organization that supports Dr. Holzinger’s mission trips (SEE - Surgical Eye Expeditions) runs training courses at their headquarters in Santa Barbara since 2006. In fact, Dr. Holzinger went to the very first course they organized.

The course on Saturday was organized by SEE and Wills Eye to provide the same type of training as SEE offers on the West Coast. The full-day course trained 10 experienced eye surgeons from as far away as Minnesota, Boston and Washington D.C. The goal of the course was for the participants to learn the techniques and then to practice in a lab setting. We hope that the surgeons will be inspired to volunteer in poor countries to help the blind regain sight. Dr. Holzinger has been lucky enough to participate in 45 missions in 15 different countries over his career as an ophthalmologist. During those missions his teams have performed over 2200 cataract surgeries.

All the physicians and staff at Eye Associates and SurgiCenter are proud to say they work with Dr. Holzinger. “He does this from the bottom of his heart” says Dr. Tyson. “He is always giving back selflessly! We are happy to have him here with us, and I’m sure the people he services with his surgical abilities are as well.”
